

5.0TA Propane Tank Compartment Bottom Flange Protector

Loading a freshly filled propane tank into a 5.0TA is difficult because you are stooped over and it is hard to lift the tank. This makes it likely that the weight of the tank will damage the weather stripped flange on the bottom of the propane tank compartment. I solved this problem by cutting a kerf into a 2" X 10" piece of pine so it will fit over the flange.
